CAUTION: TO REDUCE THE RISK OF ELECTRIC SHOCK, DO NOT REMOVE COVER (OR BACK)
NO USER-SERVICEABLE PARTS INSIDE.
REFER SERVICING TO QUALIFIED SERVICE PERSONNEL.

All warning and safety instructions pertain to the organ and the amp rack (if required).

Explanation of Graphical Symbols:

The lightning flash with arrowhead symbol within an equilateral triangle is intended to alert the user to the presence of uninsulated "dangerous voltage" within the instrument's enclosure that may be of sufficient magnitude to constitute a risk of electrical shock to persons.

The exclamation point within an equilateral triangle is intended to alert the user to the presence of important operating and maintenance (servicing) instructions in the literature accompanying the instrument.

Warning: To reduce the risk of fire or electrical shock, do not expose this instrument to rain or moisture. Do not plug the instrument into any current source other than 105-128 volts, 50/60 Hertz alternating current (AC). A certified grounded outlet is essential to proper operation and protection of the instrument. Proper polarity should be checked with an AC circuit analyzer before connecting the instrument.

To reduce the risk of electrical shock, match the wide blade of the instrument AC cord power plug to the wide slot in the receptacle and fully insert the plug into the receptacle.

Do not change the cable plug or remove the ground pin or connect with a two-pole adapter.

If you are in doubt about your electrical connection, consult your local electrician or power company.

For safety reasons, make sure any equipment or accessories connected to this instrument bear the UL listing symbol.

Read and comply with all instructions and labels that may be attached to the instrument.

In churches where circuit breakers are turned off between worship services, the circuit breaker affecting the organ console AC power should have a guard installed to prevent its being accidentally switched off.
IMPORTANT SAFETY INSTRUCTIONS

These safety instructions are provided to reduce the risk of fire, electric shock and injury. **WARNING** -- When using electric products, basic precautions should always be followed, including the following:

1. Read and understand all instructions and warnings.
2. This product may be equipped with a polarized line plug (one blade wider than other). This is a safety feature. If you are unable to insert plug into outlet, contact an electrician to replace obsolete outlet. Do not defeat the safety purpose of the plug.
3. Do not overload wall outlets and extension cords. This can increase the risk of fire or electric shock.
4. Do not allow anything to rest on the power cord.
5. Care should be taken so that objects do not fall and liquids are not spilled into the enclosure through openings.
6. Unplug the wall outlet and consult qualified service personnel in any of the following situations:
   - The power supply cord is frayed or damaged.
   - Liquid has been spilled into the product.
   - The product has been exposed to water.
   - The product does not appear to operate normally or exhibits a marked change in performance.
   - The product has been dropped, or the enclosure damaged.
7. This product, either alone or in combination with an amplifier and headphones or speakers, may be capable of producing sound levels that could cause permanent hearing loss. Do not operate for a long period of time at a high volume level or at a level that is uncomfortable. If you experience any hearing loss or ringing in the ears, you should consult an audiologist.
8. Do not attempt to service the product beyond that described in the owners manual. All other servicing should be referred to qualified service personnel.

**Grounding instructions** - This product must be grounded. If it should malfunction or break down, grounding provides a path of least resistance for electric current to reduce the risk of electric shock. This product is equipped with a cord having an equipment-grounding conductor and a grounding plug. The plug must be plugged into an appropriate outlet that is properly installed and grounded in accordance with all local codes and ordinances.

**DANGER** — Improper connection of the equipment-grounding conductor can result in a risk of electric shock. Check with a qualified electrician or serviceman if you are in doubt as to whether the product is properly grounded. Do not modify the plug provided with the product - if it will not fit the outlet, have a proper outlet installed by a qualified electrician.

CONSIGNES DE SÉCURITÉ IMPORTANTES

Les consignes de sécurité ci-dessous sont destinées à réduire les risques de feu, de court-circuit et de blessure.

ATTENTION : En utilisant des produits électriques, les précautions de base doivent toujours être prises, y compris les suivantes :
1. Lire et respecter toutes les instructions et les avertissements.
2. Ce produit est équipé d’une prise d’alimentation où les polarités sont repérées (les plots de connexion ne peuvent pas être inversés). Ceci est une mesure de sécurité. Si vous ne pouvez pas connecter la prise d’alimentation de l’instrument à votre prise murale, contactez un électricien pour la remise en conformité de votre prise. Ne supprimez jamais la terre de la prise d’alimentation.
4. Ne rien poser sur le câble d’alimentation.
5. Il convient de faire attention à ce que des objets et des liquides ne soient pas renversés dans la console par les ouvertures.
6. Débranchez l’orgue et consultez un technicien Allen dans tous les cas suivants :
   - le cordon d’alimentation est détérioré,
   - du liquide a été renversé dans l’instrument,
   - l’instrument a été exposé à l’eau,
   - l’orgue ne parait pas fonctionner normalement ou montre des performances altérées.
   - l’instrument est tombé et la console est abîmée.
7. Cet instrument, seul ou en combinaison avec un amplificateur et un casque ou des haut-parleurs, est capable de produire des niveaux de sons qui pourraient causer une perte permanente d’audition. ALLEN ORGAN COMPANY

For more than fifty years—practically the entire history of electronic organs—the Allen Organ Company has sought to build the finest organs that technology would allow.

In 1939, Allen built and marketed the world's first purely electronic oscillator organ. The tone generators for this first instrument used two hundred forty-four vacuum tubes, contained about five thousand components, and weighed nearly three hundred pounds. Even with all this equipment, the specification included relatively few stops.

By 1959, Allen had replaced vacuum tubes in the oscillator organs with transistors. Thousands of transistorized instruments were built, including some of the largest, most sophisticated oscillator organs.

Only a radical technological breakthrough could improve upon the fine performance of Allen's solid-state oscillator organs. Such a breakthrough came in conjunction with the U.S. Space Program in the form of highly advanced digital microcircuits.

Your Protégé™ organ is the product of years of refinement in digital techniques by Allen engineers. It represents the apex of computer technology applied to exacting musical tasks. The result is an instrument of remarkably advanced tone quality and performance.

Congratulations on the purchase of your new Allen Digital Computer Organ! You have acquired the most advanced electronic organ ever built, one that harnesses a modern computer to create and control beautiful organ tones.

Familiarize yourself with the instrument by reading through this booklet. The sections on stop description and organ registration are intended for immediate use as well as for future reference.

DESCRIPTION OF STOPS

PITCH FOOTAGE

The number appearing on each stop along with its name indicates the “pitch” or “register” of the particular stop. It is characteristic of the organ that notes of different pitches may be sounded from a single playing key. When this sound corresponds to the actual pitch of the playing key, the note (or stop) is referred to as being of 8’ pitch; therefore, when an 8’ stop is selected and Middle C is depressed, the pitch heard will be Middle C. If it sounds an octave higher, it is called 4’ or octave pitch. If it sounds two octaves higher, it is called 2’ pitch, while a stop sounding three octaves higher is at 1’ pitch. Likewise, a 16’ stop sounds an octave lower, and a 32’ stop sounds two octaves lower.

Stops of 16’, 8’, 4’, 2’, and 1’ pitch all have octave relationships, that is, these “even numbered” stops all sound octaves of whatever key is depressed. Pitches other than octaves are also used in organ playing. Their footage number always contains a fraction, and they are referred to as mutations. Among these are the Nasard and Quinte 2-2/3’, Tierce 1-3/5’, and Quintflûte 1-1/3’. Because they introduce unusual pitch relationships with respect to the fundamental (8’) tone, they are most effective when combined with other stops, and are used either in solo passages or in small ensembles of flutes (see explanation of Cornet in Section II).

TONAL FAMILIES

Organ tones divide into two main categories: flues and reeds. In a pipe organ, flue pipes are those in which the sound is set in motion by wind striking directly on the edge of the mouth of the pipe. Flues include principal tones, flute tones, and string tones. Compound stops and hybrid stops are “variations” within these three families.

The term “imitative” means that the organ stop imitates the sound of the corresponding orchestral instrument; for example, an imitative “Viola 8” would be a stop voiced to sound like an orchestral viola.

**Section I**
**AP-9 STOPLIST**

Following is a discussion of individual stops and how they are generally used. Please note that slight variations in specifications may be encountered.

**PEDAL ORGAN:**
- **Contra Violone 32’**
  - Rich string tone at the bottom of the Pedal division.
- **Diapason 16’**
  - The 16’ member of the Pedal principal chorus. Strongest pedal flue stop.
- **Bourdon 16’**
  - Stopped flute tone of weight and solidity.
- **Lieblichgedackt 16’**
  - Softer stopped flute of delicacy and definition.
  - (Swell expression)
  - Useful where a soft 16’ pitch is required.
- **Octave 8’**
  - 8’ member of the Pedal principal chorus.
- **Gedacktflöte 8’**
  - Stopped flute tone of 8’ pitch, useful in adding clarity to a pedal line in combination with the Bourdon 16’ or Lieblichgedackt 16’.
- **Viola 8’**
  - (Swell Expression)
  - Soft string tone, useful for light combinations.
- **Posaune 16’**
  - (Swell Expression)
  - A strong Pedal reed that lends strength and “snarl” to the Pedal line.
- **Trompette 8’**
  - (Swell Expression)
  - Clear Pedal reed useful in adding definition to a full pedal combination, or as a solo Pedal trumpet.
- **Great to Pedal**
  - Connects all Great stops to the Pedal.
- **Swell to Pedal**
  - Connects all Swell stops to the Pedal.
- **MIDI on Pedal**
  - Opens MIDI channel to the Pedal.
SWELL ORGAN:
Gedackt 8’  Stopped flute tone of moderate harmonic development. Provides the 8’ member of the Swell flute chorus and is useful by itself or with other flutes and mutations in creating solo voices.

Viola 8’  Soft string tone.

Viola Celeste 8’  String tone, slightly detuned, used with the Viola 8’ to create a warm string celeste.

Celestes are created by using two sounds, one tuned slightly sharp or flat of the other, creating a warm, undulating, “celestial” effect. The combination of the Viola 8’ and Viola Celeste 8’ will create beautiful celeste sounds.

Spitzprinzipal 4’  Hybrid stop which is predominantly principal tone with a string like edge.

Traversflöte 4’  Distinctive stopped flute voice that works well in ensembles of flutes or strings, or as a solo voice.

Nasat 2-2/3’  Flute mutation that sounds one octave and a fifth above the keys played. Always used with other stops (usually beginning with 8”) for coloration.

Blockflöte 2’  A delicate, clear open flute at 2’ pitch.

Terz 1-3/5’  Flute mutation that causes the pitch to sound a seventeenth (two octaves and a third) higher than played. Used with 8’ stops or flute ensembles.

Fourniture IV  Compound stop, or mixture, comprised of principal tones. Each note played produces four distinct pitches at octave and fifth relationships to the key being pressed. The Mixture IV should never be used without stops of lower pitches. The Mixture IV is typically added to diapason or flute ensembles, or to a reed chorus.

Contre Trompette 16’  Chorus reed tone at the 16’ pitch level, designed to supplement the other chorus reeds. Also usable as a distinctive solo reed.

As pitches progress upward, they “break” back to the next lower octave or fifth. Used to cap the Great principal chorus, adding brilliance and pitch definition throughout the entire compass.</td>

**EXPRESSION PEDALS**
There are three expression pedals on the AP-9. The one on the far right is the Crescendo pedal (see below). The pedal on the left expresses the Great, Positiv, and Pedal divisions, while the center expression pedal affects the Swell.

**CRESCENDO PEDAL**
One master Crescendo, for all divisions, gradually adds stops as this pedal is opened. Indicator lights show the relative position of the pedal. Indiscriminate use of the Crescendo pedal, in lieu of careful registration, should be avoided.

**TUTTI I**
The Tutti I is a reversible piston which draws a full organ registration. Tutti I is turned on by using a manual piston located on the Great manual directly above the Cancel button on the Positiv. The Cancel button will turn off the Tutti. A red signal light, appropriately labeled and located on the right side of the console to the left of the expression indicators, will turn on when Tutti I is in operation. Like the Crescendo, indiscriminate use of this device should be avoided.
ARTISTIC REGISTRATION

Organ registrations fall into two broad categories: solo combinations and ensembles.

A solo combination is one in which a melody is played on one keyboard, the accompaniment on another keyboard, and the pedal often provides a light bass line. Almost any stop or combination of stops will sound good as a solo voice. A contrasting tone quality should be chosen for the accompaniment, so that the accompaniment is softer than the solo voice. The Pedal stops must provide a foundation for the sound without covering it.

Most 8’ reed stops make interesting solo voices. The addition of a 4’ flute or a flute mutation (e.g., Nasat or Terz) to a reed such as the Trompette colors the sound further and increases its volume slightly. Adding an 8’ flute to a reed will add body to the sound.

Flutes can be used alone or in combinations as solo voices. One special combination of flutes that creates an appealing and historically significant solo combination is the Cornet (pronounced kor-NAY). The Cornet is created by using the following Swell stops: Gedackt 8’, Koppelflöte 4’, Nasat 2-2/3’, Blockflöte 2’, and Terz 1-3/5’. This solo combination was used widely in Baroque organ music, but it is just as appropriate for some modern music. Useful variations of the Cornet may be achieved by eliminating the 4’, the 2’, or both.

When choosing stops for a solo voice, it is not always necessary to include an 8’ stop; for example, since the 4’ flute has a tone quality different from that of the 8’ flute, the 4’ flute can be used as an independent solo voice. By playing the solo an octave lower than written, the notes will sound at the correct pitch. In similar fashion, a 16’ stop can be selected and the notes played an octave higher than written. Tonal variety will be gained, because each stop has its own tone color.

For accompaniment, the most desirable voices are the 8’ flutes or strings on each manual. Celestes often make effective accompaniments. The correct choice depends on the volume of the solo tone (a soft solo voice requires the softest accompanimental stop), the element of contrast, and the location of the solo stop. A bright, harmonically rich solo reed, for example, can be accompanied by either a string or flute, but the flute will often contribute greater interest because of its greater contrast.

Try to seek a “natural” balance of volume between solo and accompaniment. This will be especially easy to accomplish since the solo and accompaniment are under separate expression.

These few combinations demonstrate basic techniques of solo registration. In creating registrations of your own, remember these three simple rules:

1. Seek tonal contrast between solo and accompaniment.
2. Be sure the solo is louder than the accompaniment.
3. Choose a solo whose character is appropriate to the specific piece.

ENSEMBLE REGISTRATIONS

Ensemble registrations involve groups of stops that are played together, usually, but not always, with both hands on one keyboard. They are characterized by compatibility of tone, clarity, and occasionally power. Such registrations are used in hymn singing, choir accompaniments, and much of the contrapuntal organ literature.
Volumes have been written on the subject of ensemble registration. Following is a summary of the major points.

Ensembles are created by combining stops. Two factors are always to be considered: tone quality and pitch. Ensembles begin with a few stops at the 8' and/or 4' pitch and expand "outward" in pitch as they build up. New pitches are usually added in preference to another 8' stop.

Ensembles are generally divided into three tonal groupings or "choruses":

The Principal chorus is the most fully developed with representation in various divisions of the organ and at every pitch from 16' (Diapason) to high mixtures. The Principal chorus is sometimes called the narrow-scale flue chorus, a reference to the relative thinness of Principal pipes in relation to their length.

The Flute chorus is also well represented with a diversity of stops at various pitches. Generally speaking, the Flute chorus is composed of less harmonically developed tones, and is smoother and of lesser volume than the Principal chorus. The Flute chorus is sometimes called the wide-scale flue chorus, owing to the generally "fatter" look of flute pipes as compared to principals.

The Reed chorus includes those reed tones designed to be used in the ensemble buildup. Not all reed voices are ensemble tones. An Hautbois, for example, is usually a solo stop. The various Trumpets, Clairons, Bassons, etc., are usually ensemble voices that add brilliance, power, and incisiveness to the sound. If you have questions as to whether a specific reed is a solo or ensemble stop, refer to the stoplist in the preceding section.

The Swell Reed chorus of Basson 16' and Trompette 8' represents an entity important to French organ music and the full ensemble of the organ. These stops create a "blaze" of richly harmonic sounds that tops off both flue choruses.

Another special ensemble combination important in French music is the Cornet, which was discussed earlier in this section. This combination can be used with the chorus reeds and mutations to create the "Grand Jeu." The Cornet is also useful in Romantic ensembles to add weight and thickness to the sound.

Here are typical ensemble combinations for the Swell and Great manuals:

**Great**

1. Harmonic Flute 8', Spitzflöte 4'

**AP-9**  

**11**  

**Section II**
2. Harmonic Flute 8', Spitzflöte 4', Superoctave 2'
3. Diapason 8', Octave 4'
4. Diapason 8', Octave 4', Superoctave 2'
5. Diapason 8', Octave 4', Superoctave 2', Mixture IV
6. Diapason 8', Harmonic Flute 8', Octave 4', Spitzflöte 4', Superoctave 2', Mixture IV, Swell

1. Gedackt 8', Viola 8'
2. Gedackt 8', Viola 8' Traversflöte 4'
3. Gedackt 8', Viola 8' Traversflöte 4', Blockflöte 2'
4. Gedackt 8', Viola 8' Spitzprinzipal 4', Traversflöte 4', Blockflöte 2'
5. Gedackt 8', Viola 8' Spitzprinzipal 4', Traversflöte 4', Blockflöte 2', Fourniture IV
6. Gedackt 8', Viola 8' Spitzprinzipal 4', Traversflöte 4', Blockflöte 2', Fourniture IV, Trompete 8'

The use of the Swell to Great and Positiv to Great couplers allow these separate ensembles to be combined on the Great manual. It is also possible to combine some of these ensembles within the same division; for example, the #2 Great and #4 Swell registrations coupled together and played on the Great combine to form a nice round hymn combination.

The Pedal and Positiv ensembles are created in much the same way as the manual ensembles, with the Pedal starting at 16' pitch instead of 8'. Be careful that the volume of the pedals is not greater than that of the manuals. Although the manual to pedal couplers are useful in bringing clarity to the pedal line, especially on softer registrations, avoid the temptation to rely constantly on one or two 16' stops and a coupler. Please note that the softest stops and flute mutations are normally not used with ensembles.

**FULL ORGAN**

Due to the immense capabilities of the Allen Digital Computer Organ, every stop and coupler on the instrument could be used simultaneously without distortion, if the organ is adjusted properly. In good registration practice, however, the organist would not haphazardly put on every stop on the instrument. For best results, listen and include only those stops that really contribute to the fullness and brilliance of the ensemble. Eliminate soft stops and solo stops that make no purposeful contribution.

This short treatment barely scratches the surface of the fascinating subject of organ registration. For those interested in gaining further insight into this vital area of organ playing, we recommend the following texts:

TRANSPOSER

Vast computer capability makes it possible to perform the sometimes difficult task of transposing, while allowing the organist to play in the notated key. Operation of the Transposer is controlled by the Transposer knob, found to the right on the front of the console. Neutral (no transposition) position for the knob is marked “●.” To shift the music to a higher key, move the knob counter-clockwise. The key can be raised a maximum of five half-steps. To shift to a lower key, move the Transposer knob clockwise from “●.” The key can be lowered a total of seven half-steps. A RED INDICATOR LIGHT COMES ON WHENEVER THE TRANSPOSER KNOB IS MOVED FROM THE “●” POSITION.

WHY TRANSPOSE?
1. Because the range of a song will not always suit the vocal range of a particular singer. By adjusting the transposer, the piece can be sung more comfortably and effectively.

2. Because some instruments are non-concert pitch. A trumpet in B♭, for example, can play the same music as the organist, if the Transposer knob is set two half-steps lower.

3. Because hymn singing can sometimes be improved by a more favorable key selection. Hymn singing can also be enhanced by playing the hymn in its original key, and then playing a short modulation at the end of the stanza that leads into the key one-half step above the key in which the hymn is written. If the hymn is already in a fairly high key, it may be preferable to play the first few stanzas with the Transposer set down one-half or one whole step, then modulate up to the original key for the final stanza.
SPECIAL PROGRAMMABLE CONSOLE FUNCTIONS

I. Description
II. Selecting the four capture memories
III. Setting pistons
IV. Choosing MIDI Expression pedal functions
V. Selecting the desired expression mode
VI. Restoring factory settings
VII. Automatically checking the capture and stop action

I. DESCRIPTION
A. The AP-9 is equipped with a programmable control system that provides useful extra functions. It is not necessary for the organist to use all available features to play the instrument. The organ is capable of all traditional functions without the use of the control system. The control system provides additional flexibility for those organists whose requirements go beyond the capabilities of the traditional organ console.

II SELECTING THE FOUR CAPTURE MEMORIES
A. Locate the Capture Keylock switch on the right side of the console. It is possible to select memory A, B, C, or D. NOTE: Memory D has been programmed at the factory with combinations on all pistons, although it can be re-programmed by the user. If Memory D is changed, the original factory capture settings are stored and can be recalled by restoring the factory settings.

III SETTING PISTONS
A. Allen’s Quadruple Lumitech Capture System allows the organist to set four complete groups of piston combinations covering the entire organ. Select the capture memory you wish to use by turning the Capture keylock switch to the desired memory.
B. Choose a stop combination that you wish to place, for example, on General Piston 1. General pistons are found on the left side of the console underneath the Swell and Great manuals and are numbered 1 through 10. Remember that General pistons are customarily set using graduated stop combinations from soft to loud. After you have selected your stops, press and hold the “Set” button and then press and release General Piston 1. Release the “Set” button. General Piston 1 will now turn on the stops in that combination whenever it is pressed. The pistons can be changed at will.
1. The six pistons located in the center of the console below each keyboard affect only the stops for the keyboard directly above them. Follow the same procedure to set these Divisional pistons. You can go through the entire organ this way.
2. The interdivisional couplers (i.e., Swell to Great, Swell to Pedal, and Great to Pedal) can be set only on the General Pistons. They are not affected by the Divisional pistons.

IV. CHOOSING MIDI EXPRESSION SETTINGS
A. The expression pedal controls the volume of the organ regardless of the setting of the MIDI expression function. When using the organ in conjunction with other MIDI devices, however, it is possible to choose from the following types of MIDI data transmission via the expression pedal.

1. Poly - Volume: this is the default (normal) mode. MIDI volume information is transmitted from each division on the MIDI channel assigned to that division. Swell MIDI data is transmitted on MIDI Channel 1, Great on Channel 2, Pedal on Channel 3, and Positiv on Channel 4. This is the proper mode to use when recording to, or playing back from, a sequencer.

2. Poly - Velocity: should be selected if you are using a percussion voice from an external MIDI keyboard. For example, if a digital piano sound were played from the organ keyboard through Channel 1, the piano could be made to sound more realistic in this mode. By depressing the Expression pedals the piano “strings” would sound as if they were struck “harder” than when the pedals were in the closed position. The transmission channels for all divisions are stated later in this section. NOTE: When in this mode, all expression information is sent in key velocity form. Changes in velocity will occur only when a new note is struck; consequently, if you change the position of the Expression pedals after a note is struck, there will be no change in velocity until a new note is struck. Do not use this mode when recording to a sequencer, or the organ’s expression will not function when playing back from the sequencer.

3. Swell - Volume: sends MIDI expression data only on the Swell MIDI channel. Information is transmitted on MIDI Channel 1. Some MIDI devices do not respond properly to MIDI volume information on multiple channels. If a MIDI device does not properly receive volume information when the organ is in Poly - Volume mode, use the Swell - Volume mode. It may be
necessary to set the MIDI channel of the external device to MIDI Channel 1.

4. No Expression: cancels transmission/reception of expression data.

V. SELECTING THE DESIRED EXPRESSION MODE

A. Press and hold the “Set” piston and press the “R” piston once. The flashing “PowerOn” light indicates that the organ is in the MIDI Expression Selection Mode and that the current setting is Poly - Volume. This setting is automatically engaged when the organ is switched on.

B. To select Poly - Velocity, press General Piston 2. The bottom lights of the Gt/Po/Pd indicator will now flash, indicating that the organ is now in Poly - Velocity mode.

C. To select Swell - Volume, press General Piston 3. The lights of the Swell expression indicator will now flash, indicating that the organ is now in Swell - Volume mode.

D. To select No Expression, press General Piston 4. The lights of the crescendo indicator will now flash, indicating that the organ is now in No Expression mode.

E. If a different setting is chosen, and the Expression Selection Mode is re-entered later, the current setting will be shown by the appropriate flashing lights as described above. To return to Poly - Volume mode, re-enter the Expression Selection Mode and press General Piston 1. The Power On light will flash, indicating that the organ is now in Poly - Volume mode.

F. To return to normal playing mode, hold the “Set” Piston and press the “Cancel” Piston.

VI. RESTORING FACTORY SETTINGS

A. Capture Memory D can be restored to the original factory setting.
   1. To enter the Factory Setting Restoration Mode, press and hold the “Set” button and press the “R” piston three times. The flashing Tutti I light indicates that the organ is in the Restoration mode.
   2. To restore all factory settings, press Great Piston 1.
   3. To return to normal playing mode, press and hold the “Set” button and press the “Cancel” piston.

B. Note: All user-programmed Capture Memory D settings are erased when factory settings are restored.
AUTOMATICALLY CHECKING THE CAPTURE ACTION

A. This is a self-check of the capture system to insure that every individual stop is controllable by the capture action.

1. To enter the self-check mode, press and hold the “Set” piston and press the “R” piston four times. The light under the Tutti I indicator will now flash to indicate that the organ is in the self-check mode.

2. Start the self-check by pressing Great Piston 1. The stops will illuminate consecutively from left to right beginning with the Pedal division. If any stop does not illuminate, notify your Allen authorized service technician. You may interrupt the scanning process at any time by pressing and holding “Set” and then pressing the “Cancel” piston.

3. Music Memory
The AP-9 features Allen’s Music Memory™, a selection of pre-recorded demonstration pieces in a variety of tonal combinations and musical styles. To access these selections, press and hold the “Set” piston and press the “R” piston 4 times. The light under the Tutti I will flash indicating that the organ is now in the Demonstration mode. Demonstration pieces can be accessed using Swell pistons 1 through 5. Each piston will access a different musical selection. Piston 6 acts as a stop/continue switch. Pressing Piston 6 once will stop the selection in mid-play. Pressing Piston 6 a second time will allow the selection to continue from the point at which it was stopped. It is possible to skip from one demonstration piece to any other by simply pressing the piston of your choice during playback. To return to normal playing mode, hold the “Set” piston and press the “Cancel” piston. NOTE: The expression pedals must be fully open when using Music Memory™.
MIDI GUIDE

I. MIDI FOR ORGANISTS

A. WHAT IS MIDI?
The term MIDI is an acronym for Musical Instrument Digital Interface. MIDI has been adopted by the music industry as a standard means of communication between digital musical devices. This enables devices of different types and manufacturers to communicate with ease. It is not necessary to understand all of the technical aspects of MIDI in order to take advantage of the benefits it offers. It is important to explore the potential MIDI holds for musicians, as well as the various MIDI applications available today.

B. TYPES OF MIDI DEVICES
MIDI devices fall into two categories. The first category consists of musical instruments such as organs and synthesizers, which transmit and receive MIDI data. The second category includes controllers and processors, that, as their name implies, can transmit, receive, or manipulate MIDI data but do not necessarily produce sound themselves. Sequencers, which are MIDI recording devices, fall into this category. Although the technical nature of their recording and editing processes differs from those of a tape recorder, many operate in similar fashion. Most are equipped with record, playback, fast forward and reverse controls, that function in the same way as their tape recorder counterparts.

C. TYPES OF MIDI DATA
There are several types of MIDI messages that can be sent from one device to another. The most common is keying information, allowing one device to sense which keys have been played on another. This means that an organ equipped with MIDI can send information to other MIDI devices, e.g., synthesizers or sequencers, and can play those devices simultaneously or record information to be played back later.

Allen organs incorporate a total MIDI system allowing the transmission of volume, registrations, Crescendo settings, and more. It is even possible to control several devices from one manual simultaneously, or control different devices from each manual of the console.

D. MIDI AS A PRACTICE TOOL
For the organist/choir director, the MIDI organ console and sequencer are valuable rehearsal tools for both choral and organ works. Anthem accompaniments may be recorded in advance and played back by the sequencer during choir rehearsal, freeing the director from the role of accompanist, and allowing him to concentrate on directing the choir. The sequencer may even play the music back at a slower tempo without affecting pitch, or at a lower pitch without affecting tempo, features that are useful in rehearsing difficult choral passages. If the sequencer allows multi-tracking, each vocal section’s part may be recorded on a different track, and then played back individually, or in any combination, for increased flexibility.

Multi-tracking can also be used in teaching and learning new organ works. The teacher may record each hand or pedal part on a different track, allowing the student to “mute”, or turn off,
any part being practiced while still being able to hear the sequencer play the rest of the composition. The student’s ability to hear the piece in its entirety and to become aware of, from the earliest stage of learning a composition, the interrelationship of its voices, is especially valuable in learning contrapuntal works.

E. MIDI AS A REGISTRATION TOOL
In some churches and auditoriums it is difficult to judge the effectiveness of a registration from the organ console. Due to the acoustics of the room, or positioning of the console, the sound of the instrument may be different when listened to from the congregation’s or audience’s vantage point. MIDI allows the organist to check registrations by recording his playing and registration to a sequencer and then listening from different locations in the room during the music’s playback.

F. OTHER USES FOR MIDI
MIDI has opened new possibilities to the organist. The MIDI organ console’s ability to control external keyboards or sound modules puts an ever increasing array of non-traditional sounds at the organist’s fingertips, with a degree of control only possible through the flexibility of an organ console. The ability to record MIDI data with the use of a sequencer opens a variety of new possibilities, both in practice and performance situations. Computer programs are even available that allow musicians to play MIDI devices connected to a computer and have their performance printed out as conventional five line musical notation. Because MIDI is an industry-wide standard, today’s MIDI instruments will be compatible with tomorrow’s MIDI innovations.

II. CONNECTING THE ALLEN ORGAN TO OTHER MIDI DEVICES
The MIDI-capable Allen Organ consoles may be connected to a variety of MIDI devices. A diagram for connecting the Allen organ to a variety of MIDI devices can be found on the next page. Although the diagram is not meant to be an exhaustive list of possibilities, it illustrates the most commonly used combinations of MIDI devices. If more specific information is required, please consult the owner’s manuals of the external devices being connected to the Allen Organ.

III. SmartMIDI™
Your Allen Protégé™ organ features SmartMIDI™, an expanded MIDI system with increased flexibility. Allen’s SmartMIDI™ provides a comprehensive interface between MIDI sound modules such as the Allen MDS-Expander™, and digital sequencers such as the Allen Smart Recorder™. Two MIDI OUT ports, one switched and one unswitched, allow unprecedented control over external MIDI devices attached to the organ.

Under normal circumstances, MIDI sound modules should be connected to the switched MIDI port labeled MIDI OUT 2. Doing so allows the organist to disable the sending of MIDI data from the organ to the sound module. Devices such as MIDI sequencers should be connected to the unswitched MIDI port labeled MIDI OUT 1, eliminating the necessity of having to draw the MIDI stop controls before recording a digital sequence. The drawing below illustrates the proper procedure for connecting the Allen MDS-Expander™ II and Allen Smart Recorder™ to an Allen Protégé™ organ equipped with SmartMIDI™.
IV. MIDI Transmission Channels

MIDI information may be broadcast on several different channels simultaneously. This allows many channels of information to be sent through one cable and used independently of one another, similar to the way many television broadcasts can be sent through one cable. In order to receive the intended information, a MIDI device must be tuned to the same channel as the device which is sending the information. Your Allen organ transmits MIDI information on several channels. When external MIDI devices are connected to the organ, it is important to make sure that the devices' channels of transmission and reception match the MIDI channels of the Allen organ divisions to which they are assigned.

The AP-9 transmits MIDI on the following channels:

- Swell = Channel 1
- Great = Channel 2
- Pedal = Channel 3
- Positiv = Channel 4
- General Pistons = Channel 8

MIDI Program Change Messages are transmitted from the organ's General Pistons on MIDI Channel 1. These program change messages can be used to change the settings of MIDI sound modules or synthesizers which are connected to the organ. Please consult the owner's manual of your MIDI device(s) for more information on how MIDI Program Change Messages are handled by each particular device.

In addition to note information, MIDI Volume Messages are sent on MIDI channels 1, 2, and 3 by the organ's expression pedal. In this manner, the volume of connected MIDI devices may be controlled. Please consult the owner's manual of your MIDI device(s) for more information on how MIDI Volume information is handled by each device.

If any external MIDI device is used to transmit information to the Allen organ, the same assignment of MIDI channels must be used as outlined above.
INSTALLATION, VOICING, AND CARE OF THE ORGAN

INSTALLATION

Wherever your Protégé™ organ may be situated, careful installation is a prerequisite to successful results. Your Allen representative is well qualified to guide you in planning for this.

Factory assistance in planning the installation is also available and may, in fact, be sought by your Allen Organ representative.

VOICING

The Protégé™ organ enjoys unprecedented accuracy in the scaling and voicing of each note of every stop. This musical breakthrough is an inherent part of the engineering design of the instrument. Final adjustments in scaling and voicing involve controls within the console and are best left to an expert. These adjustments are normally a part of installation and, once done, should not require changes, unless the instrument is moved to a new location.

Bass frequency projection is strongly affected by tone cabinet location. Although none of the tone cabinets should be moved once the installation has been completed, extra care should be exercised to prevent inadvertent movement of the bass tone cabinets.

REVERBERATION

The Digital Reverberation System provides the spatial ambiance of a large reverberant auditorium. Although most effective in poor acoustic environments, it even enhances the tones in optimal acoustic settings. The Digital Reverb is on all the time.

Adjustments to the Digital Reverberation System must be made by your service technician or sales representative.
BATTERY BACKUP SYSTEM

The memory for the capture system on your Protégé™ organ is sustained by a Lithium battery. This allows capture settings and related items to be retained in memory when the organ is switched off or unplugged. Under normal circumstances, the Lithium battery should last for several years. A built-in warning system will alert you when the battery becomes weak and needs to be replaced. The green power light will flash for about ten seconds after the organ is switched on if the battery is in need of replacement.

Should the battery in your Protégé™ organ require replacement, contact your local Allen authorized service representative.

CARE OF THE ORGAN

Your Allen Digital Computer Organ constitutes a major advance in long-term maintenance-free operation. There are no regular maintenance procedures required and, therefore, no periodic maintenance schedules to be observed.

Reasonable care will keep the instrument looking beautiful for years to come. The wood surfaces may be cleaned using a soft cloth dampened with lukewarm water. A mild solution of lukewarm water and dish detergent may be used to remove fingerprints, etc. Polish dry with a soft cloth.

Do not use wax, sprays or oils on the finish. Satin finished surfaces will take on a semi-gloss appearance when waxed and will eventually become yellowed.

Keys and stop tablets should be cleaned in the following manner: Use two clean cloths. Immerse one in clear, lukewarm water and wring it thoroughly damp dry. Loosen the dirt with this cloth, then polish immediately with the dry cloth. Do not use soap or detergent on keys or stop tablets.

You have purchased a remarkable organ that not only faithfully reproduces the organ traditions of the past but also anticipates the innovations of the future. Should you have questions that are not addressed in this manual, please do not hesitate to contact your local Allen Organ representative. Welcome to the family of satisfied Allen Organ owners!
USA ONLY

CAUTION

Do not plug the instrument into any current source other than 105-128 volts, 50/60 Hertz alternating current (AC). A verified grounded outlet is essential to proper operation and protection of the instrument. Proper polarity should be checked with an AC circuit analyzer before connecting the organ.

Do not change the cable plug or remove the ground pin or connect with a two-pole adapter.

If you are in doubt about your electrical connection, consult your local electrician or power company.

In churches where circuit breakers are turned off between worship services, the circuit breaker affecting the organ console AC power should have a guard installed to prevent its being accidentally switched off.

Read and comply with all instructions and labels that may be attached to the instrument.

Warning: This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause interference to radio communications. It has been type tested and found to comply with the limits for a Class B Computing Device in accordance with the specifications in Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference in a residential installation. Should this equipment cause interference to radio communications, the user at his own expense will be required to take whatever measures may be necessary to correct the interference. Whether this equipment actually causes the interference to radio communications can be determined by turning the equipment off and on. The user is encouraged to attempt to correct the interference by one or more of the following measures:

Reorient the receiving antenna.
Relocate the organ with respect to the receiver.
Move the organ away from the receiver.
Plug the organ into a different electrical outlet, so that the organ and receiver are on different branch circuits.

If necessary, the user should consult the dealer or an experienced radio technician for additional suggestions.

CE mark shows compliance with the EMC Directive.
CAUTION
Do not plug the instrument into any current source other than that stated by the selling dealer. Proper polarity should be checked with an AC circuit analyzer before connecting the organ.

Do not change the cable plug or remove the ground pin (if applicable).

If you are in doubt about your electrical connection, consult your local electrician or power company.

In churches where circuit breakers are turned off between worship services, the circuit breaker affecting the organ console AC power should have a guard installed to prevent its being accidentally switched off.

Read and comply with all instructions and labels that may be attached to the instrument.
